

Self-Harm among Wisconsin Female Emergency Department (ED) Patients Ages 10 to 19

This factsheet describes a population with the highest self-harm injury rate.

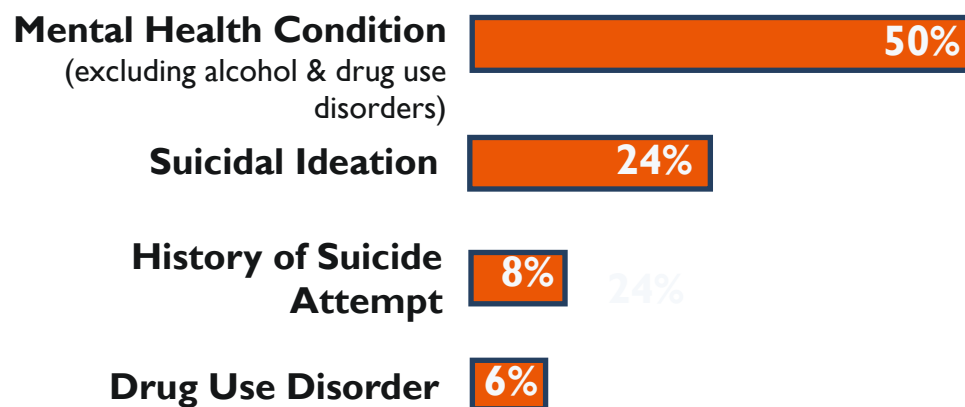

In 2021, there were **1,340** female ED patients 10-19 years-old with self-harm injuries, with or without suicidal intent.

Rate = 360 out of 100,000¹

Almost two-thirds used drugs
as method of self-harm
(prescription, legal, or illegal).

Additional health issues noted in the ED record

Repeat self-harm ED visits

91 girls (enough to fill more than one school bus) had 2 or more visits in 2021.

Comparison by race² and ethnicity³

Race	Ethnicity
<i>Higher rate compared to all females 10-19</i>	
American Indian 106% ↑	Non-Hispanic 2% ↑
Black 25% ↑	
<i>Lower rate compared to all females 10-19</i>	
White 3% ↓	Hispanic 16% ↓
Asian 52% ↓	

Disparities may be partially explained by stressors resulting from discriminatory & inequitable structures impacting BIPOC⁴ populations, which may contribute to self-harm. Discrimination by gender identity, sexual orientation, and/or class or income may also impact self-harm rates and exclusion of this information in state-reported ED data does not allow measurement.

Select Strategies to Prevent Self-harm and Suicide

- Identify and support youth through universal health screening with follow-up contacts
- Promote culturally-tailored peer support programs
- Increase access to care by expanding tele-mental health services
- Teach problem-solving skills

¹Wisconsin Hospital Emergency Department Visits; includes only nonfatal visits, treated and released from the ED, presented as patient-level. WI Department of Health Services; 2021.

²Race categories inclusive of Hispanic/non-Hispanic ethnicity. Asian race inclusive of Pacific Islander.

³Hispanic/non-Hispanic ethnicity inclusive of all races. ⁴Black, Indigenous, People of Color.
